WPI; 2003-332729/31. P-PSDB; ABB80178.

Novel isolated Aspergillus fumigatus polypeptide, useful in various industries such as those involved in the making of food and feed, beverages, textiles and detergents.

Claim 2; Page 136-39; 169pp; English

The sequences given in ABQB0119-66 encode enzymatic proteins derived from Car funigatus. The resulting proteins display the catalytic activity of an enzyme such as tannase, cellulase glucose oxidase julocamylase, laccase, phytase, beta-galactosidases, invertase, lipase, alpha amylase, laccase, phytase, beta-galactosidases, invertase, lipase, alpha amylase, laccase, polygalacturomase or xylanase. Compositions comprising cellulase are useful for modulating the amount of cellulose in a composition comprising galucose oxidase are useful for modulating the amount of cellulose in a composition comprising galucose oxidase are useful for modulating the amount of compositions comprising phytase are useful for modulating the amount of lactose in a composition. Compositions comprising phytase are useful for modulating the amount of lactose in a composition. Composition comprising during the amount of glyceride in a composition. Composition comprising comprising altonates are useful for modulating the amount of glyceride in a composition. Composition comprising comprising comprising comprising comprising comprising comprising comprising comprising comprising comprising comprising composition. Compositions comprising polygalacturohases are useful for modulating the amount of xylan or xylo-oligomer of starches or malcodaxtrins in a composition. Compositions comprising polygalacturohases are useful for modulating the amount of xylan or xylo-oligomer composition. The modulating the amount of xylan or xylo-oligomer composition. The modulating the amount of xylan or xylo-oligomer composition or composition composition or compositio

The transformed S. cerevisiae produced recombinant alpha -amylse, which was pH (pH 2-7) resistant and heat stable (80% at 60 deg. C for 60 mins.). The alpha-amylase allows the direct saccharification of starch for the produ. of alcohol, and alcoholic beverages. (Updated on 27-AMG-2003 to correct OS field.)
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                     240

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                              The present invention describes a method for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of genes in one or more second filamentous fungal cells. The method uses fluorescence—labeled nucleic acids isolated from the FF cells and a substrate of expressed sequence tags (EST). The ESTS are used in the methods for monitoring differential expression of genes in a first filamentous fungal (FF) cell relative to expression of the estate special or genes from FF cells allows the production potential of the microorganisms to be improved. New genes may be discovered, of the microorganisms to be improved. New genes may be discovered, of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene copy number variation and stability can be monitored. The expression of gene conditions, environmental stress, spore morphogenesis, recombination, metabolic or catabolic pathway engineering. Using ESTB provides several advantages over genomic or the microarrays based on function of the gene conditions as one spot on an array equals one gene or open reading frame, and organisation of the microarrays based on function of the gene products to facilitate analysis of the results. AAF0148 to AAF11847 crepresents ESTB from Aspergillus niger; AAF11848 to AAF11878 represents ESTB from Aspergillus oryzae; and AAF18737 represents ESTB from Aspergillus oryzae; and AAF18737 represents

                                                                                                                                                                       The variant alpha amylase gene was obtd. by mutating the 329th nucleotide of the alpha amylase gene of Saccharomycopsis fibuligera to T. This mutation results in substitution of the wild-type amino acid at position 84 of alpha-amylase by leucine. The variant alpha-amylase is high in transglycosifying activity. The variant alpha-amylase may be used to prepare malto-oligosaccharides with a degree of polymerisation (DP) of at least 7, by inversion of the malto-oligosaccharide. AAQ77665-8 encode variant alpha amylases, composed by substituting bases 247-249 of the structural gene region, with TTC, TGG, CTC or AAC. These substitutions result in the 83rd amino acid residue (tyrosine) of the wild type sequence being changed to phenylalanine, tryptophan, leucine or asparagine respectively. The substituted amino acid is present in the active site of the enzyme and confers increased activity on the enzyme. The variants are useful for the mass production of oligosaccharides. (see AAQ77669 for the variant structure of a cyclomaltodextrin glucanotransferase)
